

Cycle 3-Group 16

Gender and Current Alcohol Use

YRBS 2007 · N = 12,615

RESEARCH QUESTION

Primary

Is the proportion of current alcohol use different between male and female students?

Extended

Does the relationship between gender and current alcohol use vary across different age groups (12–18)?

GROUPS & VARIABLES

Independent: Sex (Male / Female), Age (12–18)
Dependent: Current Alcohol Use (Yes=used in past 30 days)

METHOD

Two-Proportion Z-Test (Primary RQ) → upgraded to
Chi-Square Tests of Independence
upon introducing Age (12–18) as a multi-level variable.

GENDER

H₀: No difference H₁: Significant difference between sex and current alcohol use

χ²(1) = 1.82, p = 0.178 → Fail to Reject H₀ ✗

AGE

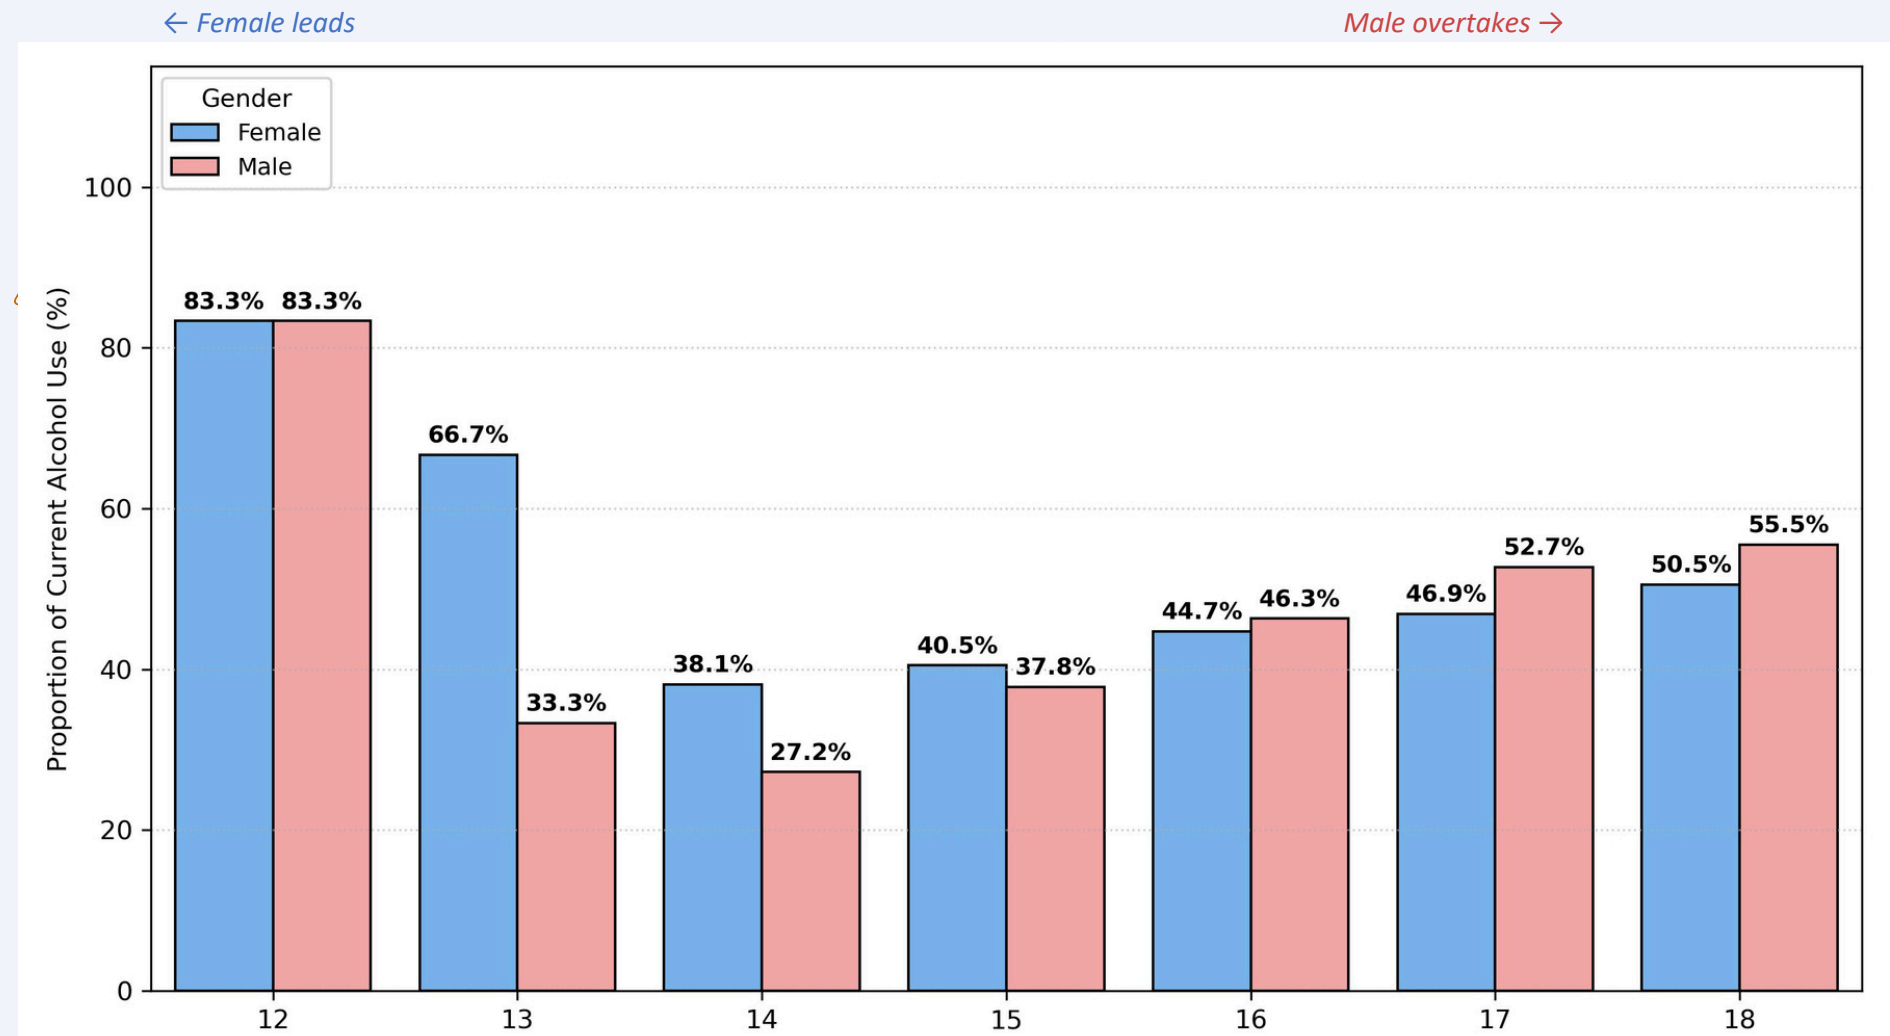

H₀: No association H₁: Significant association between age group and current alcohol use

χ²(6) = 202.41, p < 0.0001 → Reject H₀ ✓

CONCLUSION

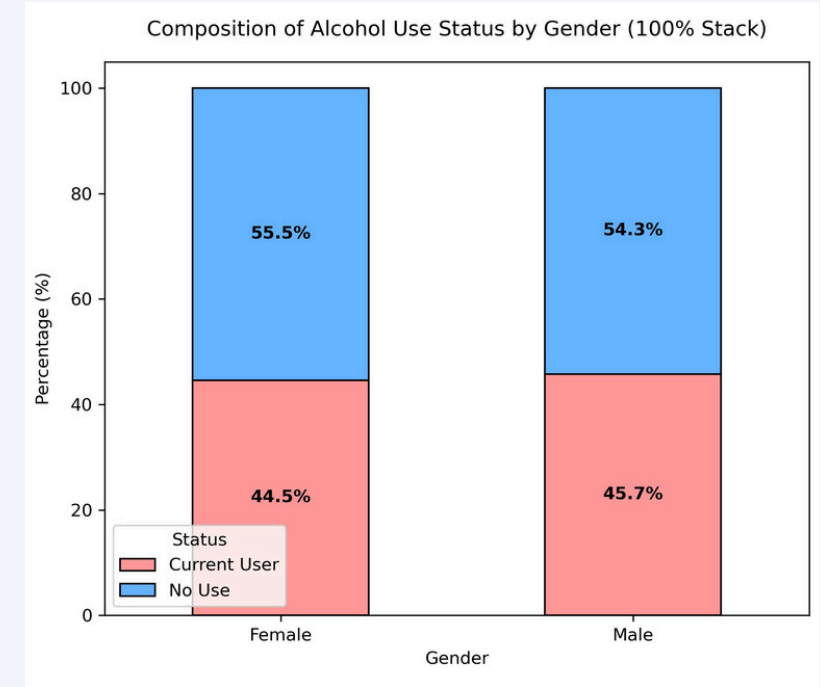

No significant overall gender gap (p = 0.178).
Age is the dominant driver. Gender differences emerge as a crossover pattern across age cohorts.

Current Alcohol Use by Age & Gender

📈 **Age Trend:** Alcohol use rises from ~32.7% at age 14 to ~53.0% at age 18 (averaged across both sexes)
★ **Crossover:** Age 14–15 Female > Male | Age 17–18 Male > Female

Overall Composition by Gender

Chi-Square Sensitivity Analysis
